DIGITAL DATA PROCESSING

ProVoteSolutions
Excellence in election integrity.

Customers post data files to our secure data site or provide their data on some form of digital media. Once the file is finished uploading, the customer informs us of its completion. The data is then transferred from the secure data site to a folder on the file server or it is downloaded directly from the media to the file server. The data is then processed/presorted with address correction services like CASS, LACS^{Link} and Delivery Point Verification. NCOA^{Link} processing is available upon request. Proofs are generated and sent to the customer for layout approval via secure data site. Once approved, production and postal eStatements are generated. Print files are impositioned and pushed to the production department for printing, converting, and inserting.
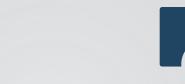

Inbound file from Customer

Transfer To Secure Data Site

ISP/Pro Network Firewall

Customer Data Supplied from Digital Media/Secure Data Site

E-mail to Customer Service of completed upload of File

File downloaded to Database Server
